

BLACK LIST/WHITE LIST

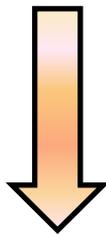

Create a contact list (blacklist) from which you do not wish to have neither phone calls nor messages or create a list (whitelist) of contacts that are allowed to call or message you.

The **Blacklist** allows you to edit a list of phone numbers from which you wish neither calls nor SMS messages. When the function is on, the blacklisted caller will hear a “network error” tone and you could receive a message from your operator signaling the number that has been trying to call you (if the activated services allow it). SMS from blacklisted numbers will automatically be transferred into the junk box.

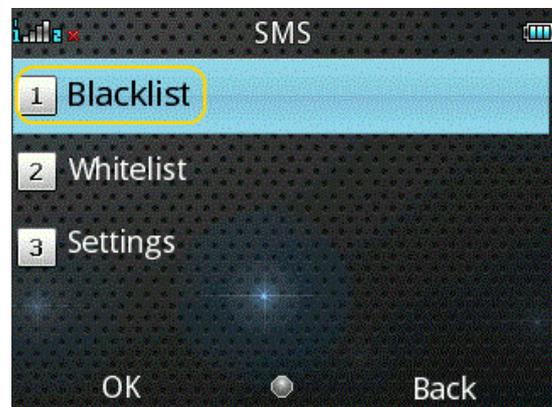

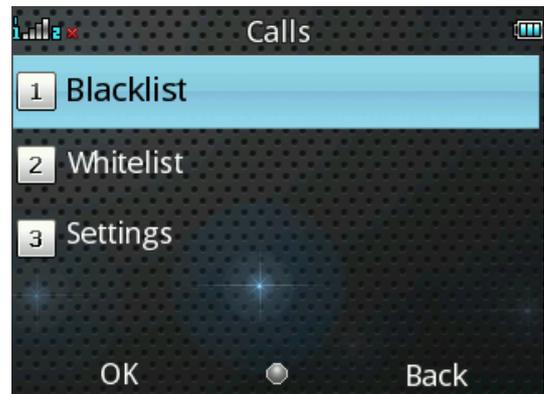

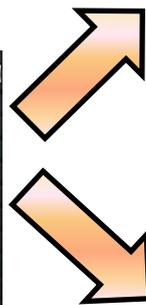

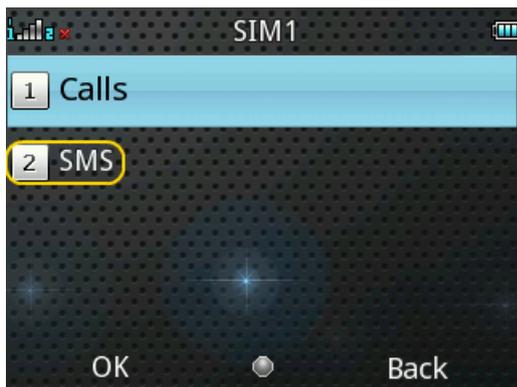

The **Whitelist** allows to select a list of numbers from which you exclusively allow incoming calls and/or messages. When the function is on, the *non* whitelisted caller will hear a “network error” tone and you could receive a message from your operator signaling the number that has been trying to call you (if the activated services allow it). SMS from *non* whitelisted numbers will automatically be transferred into the junk box.

BLACK LIST/WHITE LIST

In order to set the Black/White List, select the “Firewall” menu on the desired SIM card, on which you want to activate the option.

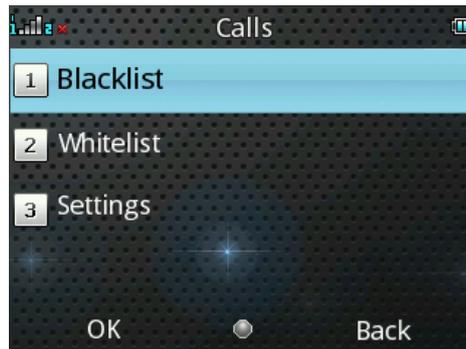

From here you can choose to activate the option for calls or for messages (or both)

BLACK LIST/WHITE LIST

From the message/calls firewall it will therefore be possible to:

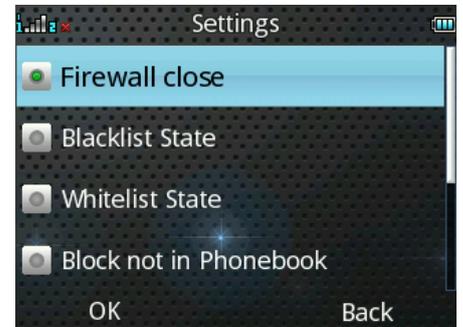

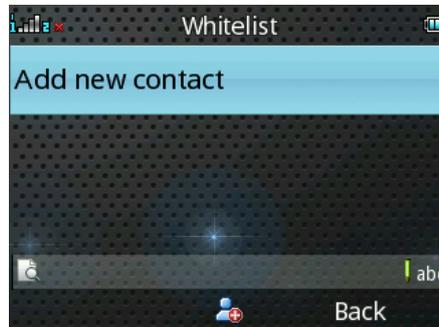

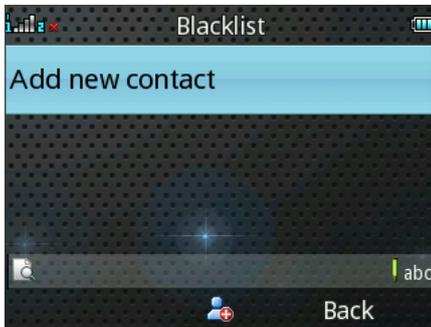

Add a contact to the
Black List

Add a contact to the
White List

Access the
Settings

Once the Blacklist/Whitelist are activated, it is possible to set the **time schedule of automatic activation**. The program options permit to set the timing and rejection method.

BLACK LIST/WHITE LIST

You can insert a contact into the Black/Whitelist for calls and/or messages also directly from the **call logs** or from the **phonebook**.

The same operation can be also done while there is an **incoming call during conversation**.

E.g., from the call logs, select a call and through Options we can insert the number into the black or whitelist
